

Oasis presentation: European innovators for sustainability:

Developing green skills in the construction sector

OASIS is a Project funded by the Erasmus programme+ in the field of VET (Vocational educational and Training) (2024-1-FR01-KA220-VET-000249336), started in December 2024 and lasting 24 months.

The project stems from the urgent need to respond to the environmental and climate challenges of our time, particularly in the construction sector, one of the largest emitters of CO₂ in Europe. With a high-value consortium at European level, OASIS aims to bridge the gap between vocational education and training (VET) and the needs of the labour market in transition towards sustainability.

The consortium

The project is coordinated by **CAPEB Grand Paris (France)**, with the involvement of:

- DELTA SCHOOLS NORTHERN GREECE S.A. (Greece)
- FALCO&ASSOCIATI SRL (Italy)
- FONDAZIONE C.I.O.F.S. – F.P. ETS (Italy)
- RUSE CHAMBER OF COMMERCE AND INDUSTRY (Bulgaria)
- ENOSI VIOMICHANION ILIAKIS ENERGEIAS (Greece)

OASIS aims to strengthen the green skills of students and vocational training professionals in the construction sector, with a specific focus on sustainable infrastructure. The project will develop and test blended learning paths, based on real case studies, educational videos, study visits and a dedicated summer school. In parallel, one of the central objectives is to promote the ecological transition in the construction sector through an integrated education and training system, developing practical and theoretical skills on environmental issues in line with current challenges. Another pillar of the project is the enhancement of the mentoring capacities of companies in the sector through the introduction of a training programme structured on the European GreenComp framework, which will enable companies to provide on-the-job learning paths focused on sustainability

OASIS also aims to strengthen the collaboration between the education system and the world of production, improve the employability of young people and support the qualification of personnel in the context of the green economy. Expected results include the creation and adoption of innovative teaching materials, the training of professionals to cope with the green transition, the strengthening of company competences in the field of sustainable training and the dissemination of a culture of sustainability in the construction sector at European level.

Why is it important to publicise the project not only on a national but also on a European level?

Because OASIS fits into the priorities of the **European Green Deal**, the European Agenda for Skills and the European Framework for **Quality Apprenticeships**. The project contributes to the development of **high quality, inclusive and future-oriented vocational training**, providing concrete tools to address the transition to a low-carbon economy.
