

Energy Performance of Buildings Directive (EPBD)

The Energy Performance of Buildings Directive (EPBD) is one of the EU's key tools in the green transition.

The Energy Performance of Buildings Directive (EPBD) is one of the EU's key tools in the green transition. It's not just a policy, it's a mindset shift in how we design, renovate, and operate our buildings.

 Under the EPBD, new buildings must be zero-emission by 2030, and existing buildings must undergo deep energy renovations to meet ambitious performance targets. This includes:

- Upgrading insulation and windows
- Installing smart energy systems
- Replacing fossil fuel heating with renewables
- Ensuring indoor comfort and health through better design

 These legal requirements affect everyone in the sector, from policymakers and developers to small construction firms and technical workers on site.

Yet many professionals still lack access to the knowledge and tools needed to apply these rules in practice.

 **That's why the OASIS Erasmus+ Project focuses on embedding green legislation and standards into vocational education.**

We help ensure that students and workers are not only aware of EU regulations, but also trained to implement them in real-world contexts. With OASIS, we bridge the gap between policy and practice, making sustainability a skill, not just a slogan.
